1 Overview

A total of 105 teams were scaled before Design. Of the cars, the lightest was 156.5kg (Vanderbilt Univ), the mean car weight was 218.9kg, and the median car was 216.8kg.

For comparison, the lightest car in 2025 was 167.8kg (University of California - Berkley), the median car was 215kg, and the average was 220.9kg.

In 2024, the lightest was 162.8kg (Vanderbilt), the median 210.9kg, and the average was 214.2kg.

In 2023, the lightest was 160.6kg (Rose-Hulman), the median 213.4kg, and the average was 216.7kg.

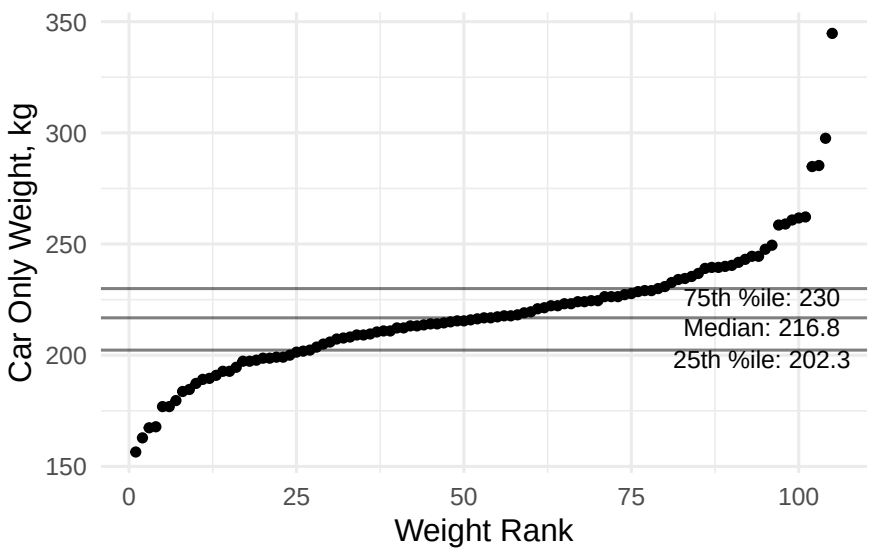
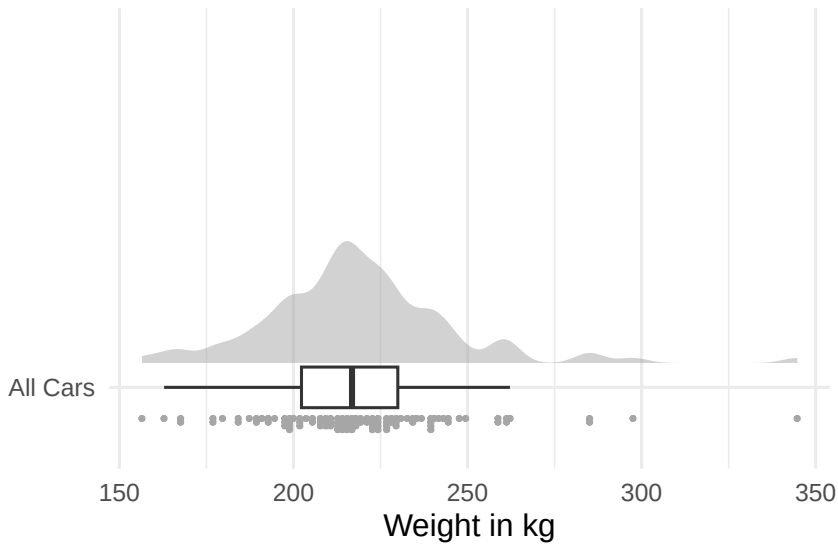
2 Weight Rank and Overall Raincloud Visualization



The weight of each vehicle is presented on the vertical, the ranking of the vehicle overall (lightest to heaviest) on the horizontal. Tables ordered by weight, car number, alphabetically, and by queue and time, are provided at the end of the page for more detail.

Below, the total distribution of weights is visualized using a "raincloud" graph, where weights rounded to the nearest kg (and frequency as dot/length of pattern) on the are at bottom, a boxplot (with outliers removed) in the center, and a kernel density plot is at the top.



3 Summary Tables - Comparisons Across Vehicle Attributes

Using information provided by teams at the time of weighing, the tables below compare the range of vehicle weights across frame type, aerodynamic package, wheel size, engine configuration/number of cylinders, and use of turbocharging. In each table, the minimum, 25th percentile, median, 75th percentile, and maximum weight are provided, as are the mean and sample standard deviation (and count of vehicles). Below the tables are "raincloud" visualizations of the data, with weights rounded to the nearest kg on the left, a boxplot (with outliers removed) in the center, and a density plot at right.

3.1 Frame Construction

Table 1: Weight Summary by Frame Construction

Frame	Median Weight	Min Weight	25% Weight	75% Weight	Max Weight	Mean Weight	StDev Weight	Count
Tube Frame	216.8	156.5	202.6	230.7	344.7	219.2	27.8	102

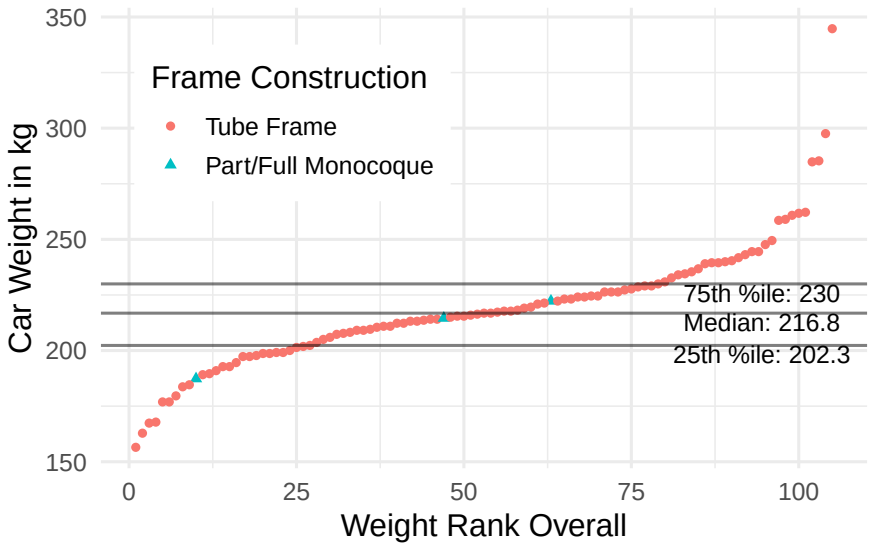
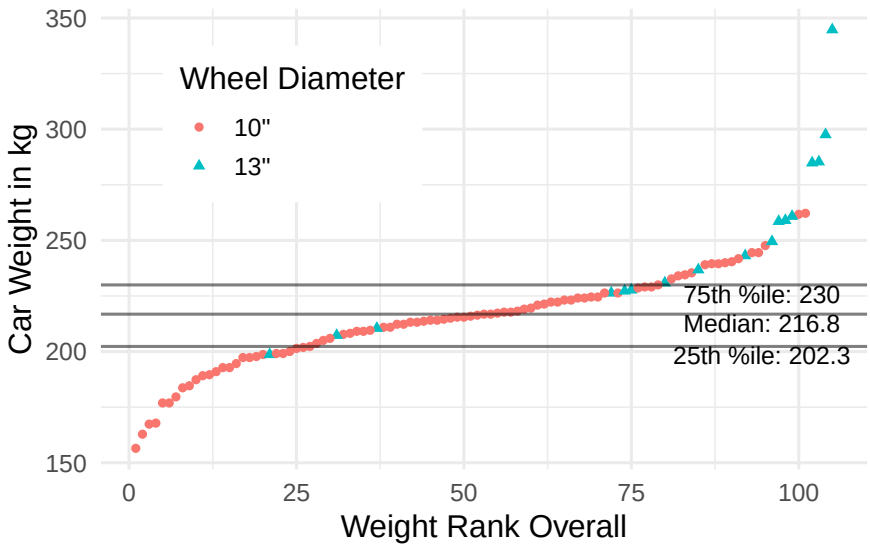
4 Weight Rank Visualizations - Comparisons Across Vehicle Characteristics

In this section, the "Weight Rank Visualization" is presented with the vehicles of different characteristics represented with color and marker shape.

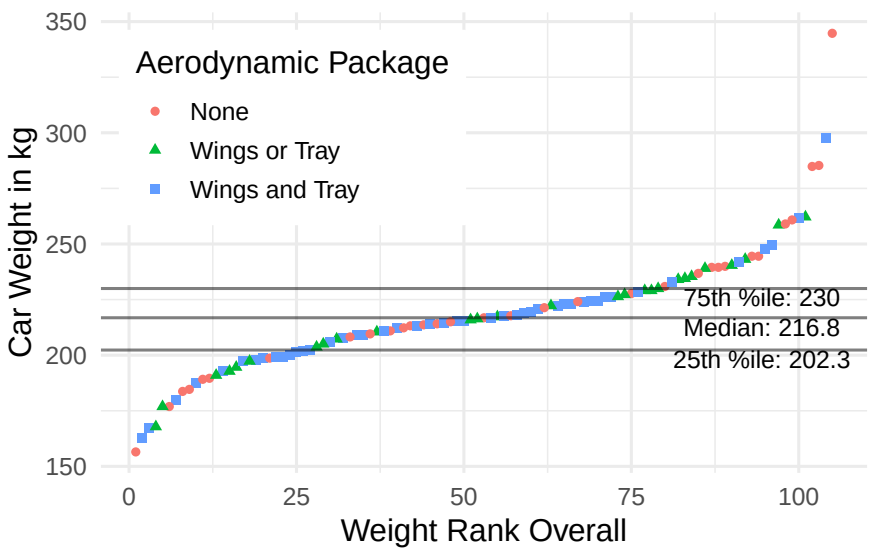
4.1 Frame Construction



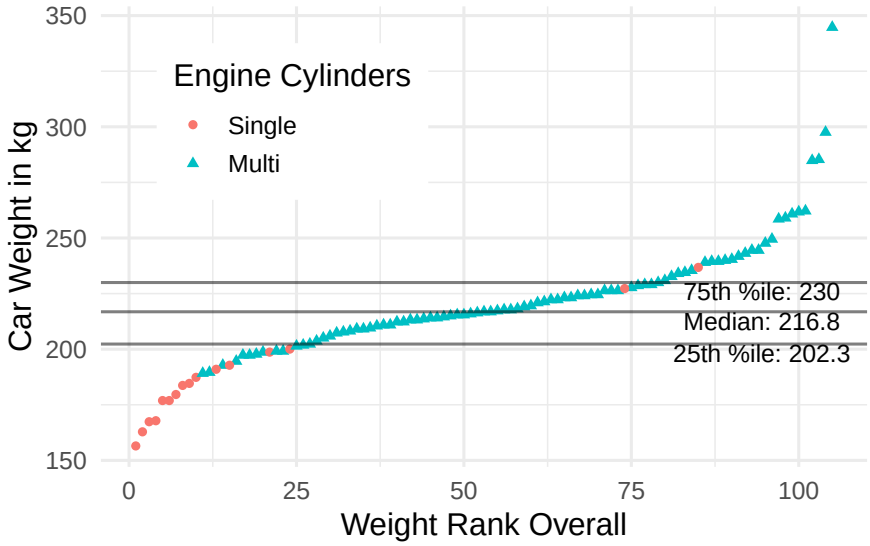
4.2 Wheel Diameter



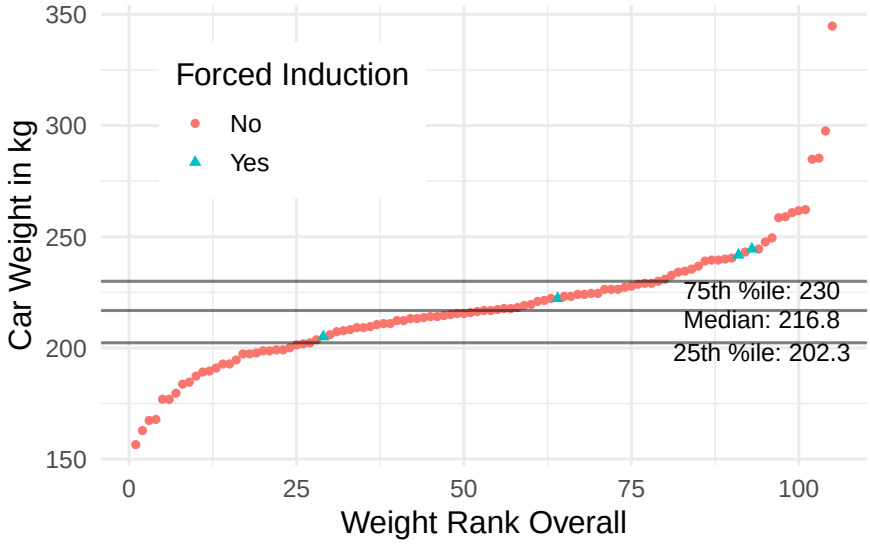
4.3 Aerodynamic Package



4.4 Engine Configuration (Single vs Multi)

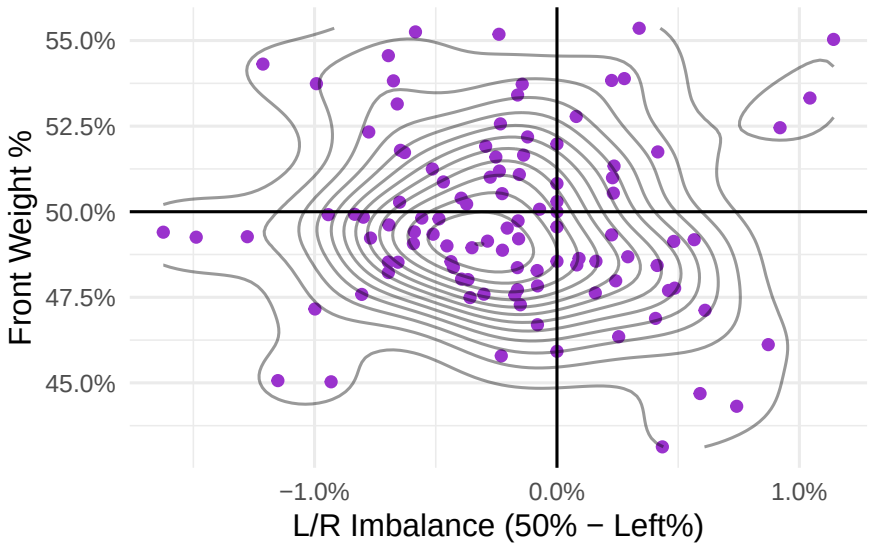


4.5 Forced Induction



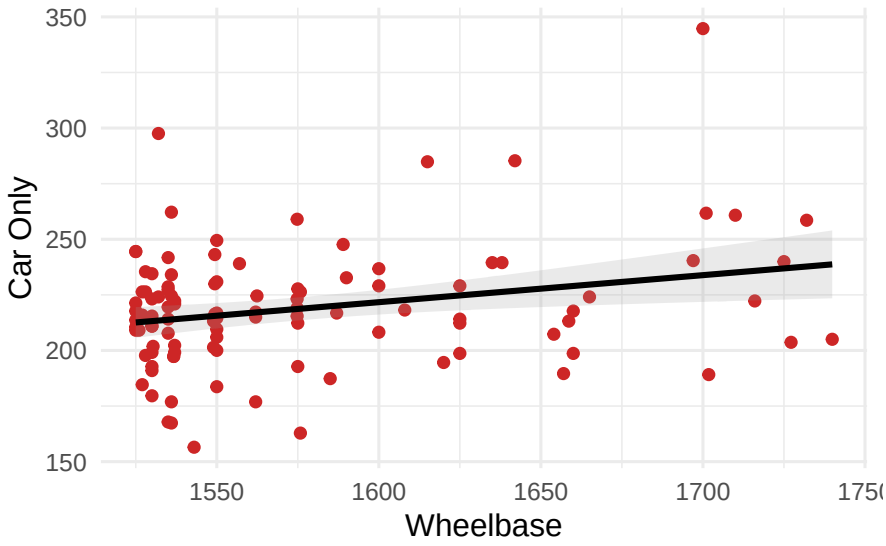
5 Weight Balance Visualization

Here, Front Weight % versus Left/Right Weight % is compared with each marker representing a car. Additionally, concentric rings represent bivariate density (joint distribution of X and Y variable), where the innermost rings are areas of highest mass/density observed (most data/observations).

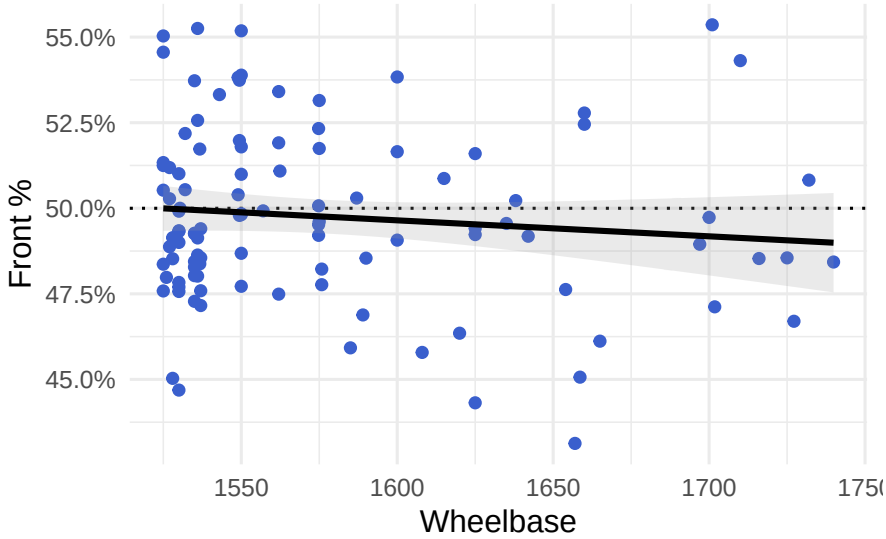


6 Wheelbase Visualizations

First, a comparison of overall vehicle weight against the wheelbase. A linear fit (with 95% confidence interval) is presented atop the scatterplot.



Second, a comparison of wheelbase against Front %. A linear fit (with 95% confidence interval) is presented atop the scatterplot.



Finally, a comparison of driver weight (as calculated by balance weights less car only weight) against front weight % is presented, including a linear fit (and 95% confidence interval).

7 Summary Tables and Chart by Queue and Design Time

Across the 15 different queues, the queue with the lowest median was Queue H, with a median weight of 199.1kg. Across the queues, the median weight varied by 33.8kg.

12 Methodology

All vehicles were weighed on Intercomp SW650 RFX scales, with the left front scale location used as common datum for all cars. The surface pad was measured within 0.1 deg of level in X, Y, and corner-to-corner, although exact pad locations for the other 3 scales varies with wheelbase and track. At last calibration (2024-04-03), all scales were certified accurate within 0.1% +/- or 1lb +/- (whichever is greater), and a spot check at site setup confirmed all scales consistent at low end (40lb) and high end (275lb) of range used on site.

Cars are weighed twice - once with the driver in the car for balance percentages (teams may select any driver, who wears a driver suit or clothing of equivalent weight and a helmet), once with the driver out (for vehicle only weight). If the driver uses a seat spacer/pad, it is removed for the car only measurement (considered driver gear). Cars are presented in dry weather configuration, and photographs of the vehicles can be checked at https://bit.ly/FSAEM26Scales
